

The AutoPilot M6 Expert for Oracle Database

Driving Business Transaction Performance™

The Challenge of Real-Time Business

Business today happens in real-time. An interrupted transaction, a slow system response, a stalled process, or anything that interferes with your business processes can start a chain reaction that costs you productivity, revenue and customers.

In a real-time business, two capabilities are key to ensuring uninterrupted business process flows:

- visibility into process flows to see the business impact every step of the way, and
- the ability to pin-point and correct problems before

The AutoPilot M6 Solution for Real-Time Business Performance Monitoring

The AutoPilot M6™ Suite from Nastel is the most powerful and feature-rich solution for monitoring and managing integrated application processes.

AutoPilot M6's consolidated graphical management dashboard gives you an end-to-end view of business process flows across your entire integrated application environment. You get unprecedented visibility into the impact of those process flows on your real-time business.

A Single Point of Control

The AutoPilot M6 dashboard also affords you the power of a single point of control. From its centralized dashboard, or remotely through

Innovative web-based interface, you have immediate access to all of the critical real-time events and performance metrics you need, and the ability to drill down on-demand to the root cause of any possible problems.

With AutoPilot M6, you can initiate corrective actions and deliver user-centric, in-context actionable alerts -- before your business processes are affected.

The **AutoPilot M6 Expert for Oracle Database** lets you add Oracle processes to this centralized big-picture view of your application infrastructure.

Extend Visibility - Expand Control

Nastel's Expert for Oracle Database is an extensible data collector that automatically gathers information in real-time on Oracle-based application processes.

The Expert for Oracle Database enables real-time visibility from AutoPilot M6's consolidated dashboard into the performance and health of business application processes that flow across Oracle systems.

Only AutoPilot M6 gives you a single, convenient point of visibility and control over your entire environment end-to-end, including:

- Business Transactions
 - Databases, like Oracle
 - Middleware
 - Applications and Application Servers
 - Integrated applications
 - Operating systems
- The Expert for Oracle Database is non-intrusive, utilizing intelligent sensors to automatically collect information about Oracle servers and their components without affecting the database
 - The modularized sensors track database performance and utilization by monitoring table accesses, transaction response times, database extends, concurrent sessions, SGA and rollbacks.
 - Easily customizable business views graphically display process status and performance metrics

AutoPilot M6 synthesizes information from Oracle and other integrated infrastructure components into on-demand snapshots of status and performance metrics for your business processes in real-time

Improve Application Performance

Every integrated application must interact with any number of systems along its transactional path, with potential points of performance degradation or failure all along the way.

AutoPilot M6 goes far beyond simple event-based monitoring. AutoPilot M6 lets you quickly and easily define new, customized events to meet your unique performance management needs.

Dynamically Create Customized Events with Oracle Performance Metrics

AutoPilot M6 automatically collects events and correlates them with the business rules, policies, thresholds and real-time conditions you specify to dynamically create new events.

These events can provide you with on-demand access to the critical performance and management metrics you need to operate your business in real-time.

With the **Expert for Oracle Database**, you can now correlate events from Oracle databases with events from any other EAI platforms and from each of the operating systems they run on, from the mainframe to your application servers and web servers.

By applying rules and thresholds in correlating events from across your infrastructure, you can foresee and prevent application performance problems before they occur.

Prevent Database Problems in Real-time

For example, you can monitor the number of times Oracle automatically extends, or allocates more disk space, and correlate that data with the volume and throughput of messages handled by your middleware.

You can apply business rules and thresholds to trace patterns in performance latency and predict the conditions that signal imminent problems. You can then define events that will be created dynamically when these conditions arise and automatically launch corrective measures — thus eliminating problems before they can impact your business processes.

AutoPilot M6's SOA Lets You Tailor Solutions That Meet Your Unique Needs

Every business is unique and every IT environment incorporates a different combination of business integration components.

AutoPilot M6 is designed with a flexible, extensible Service Oriented Architecture (SOA) that allows you to tailor the solution that's perfectly matched to your application environment.

AutoPilot M6's Expert for Oracle Database and other technology-specific experts can be added as needed to extend control over a broader range of existing technologies and over new technologies as

AutoPilot M6's SOA provides an easily configurable platform for incrementally building a solution that continues to fit your needs as your IT environment evolves

About Nastel

Nastel Technologies is a pioneer in providing on-demand business process monitoring solutions that enable businesses to operate in real-time. Nastel's AutoPilot M6 Suite gives businesses end-to-end visibility into the health of business services and control of the applications and middleware that drive business-critical transaction processes.

Nastel's solutions currently help numerous Fortune 1000-sized companies around the world, including some of the world's largest banks, financial institutions, retail chains, insurance providers and petrochemical companies achieve business agility.
